Downside: Analysis takes twice as long

### Redundancy

- Do we have redundancies in the data?
- Is RIS diverse?
  - What does this mean for BGPlay, RIS-Live?

- Current expansion strategy: add route collectors at IXPs
- Do we need other strategies for <u>better diversity</u> (= less data processing, more signal)?

# Diversity and Bias

- Is RIS (or any route collector project) representative of the Internet?
- The way we "sample the Internet" suggests it is biased
- Current value for RIS peers to peer with RIS:
  - For the good of the Internet
  - "I look better in Internet rankings"
  - ?
- We observe the "clue core"
- Are we in a "Filter Bubble"?

# Convenience Sampling

### Convenience sampling

From Wikipedia, the free encyclopedia

Convenience sampling (also known as grab sampling, accidental sampling, or opportunity sampling) is a type of non-probability sampling that involves the sample being drawn from that part of the population that is close to hand. This type of sampling is most useful for pilot testing.

### Advantages [edit]

Convenience sampling can be used by almost anyone and has been around for generations. One of the reasons that it is most often used is due to the numerous advantages it provides. This method is extremely speedy, easy, readily available, and cost effective, causing it to be an attractive option to most researchers.<sup>[2]</sup>

### Disadvantages [edit]

Even though convenience sampling can be easy to obtain, its disadvantages usually outweigh the advantages. This sampling technique may be more appropriate for one type of study and less for another.

#### Bias

The results of the convenience sampling cannot be generalized to the target population because of the potential bias of the sampling technique due to under-representation of subgroups in the sample in comparison to the population of interest. The bias of the sample cannot be measured.

Therefore, interences based on the convenience sampling should be made only about the sample itself.<sup>[9]</sup>

#### Power

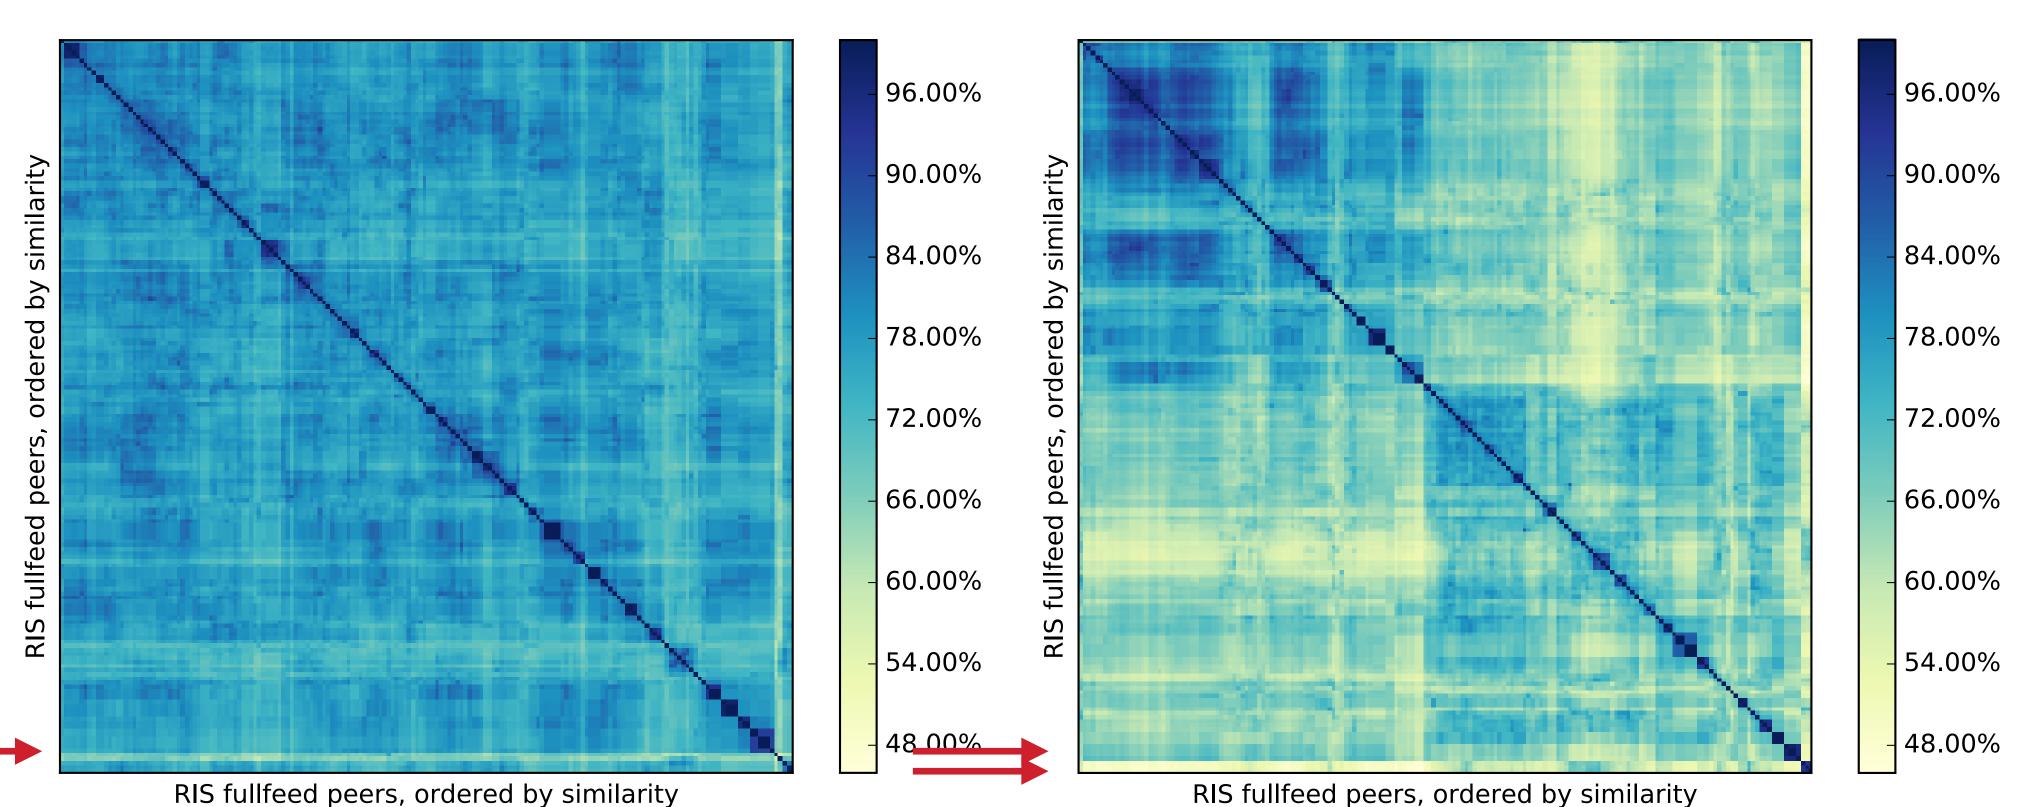

Convenience sampling is characterized with insufficient power to identify differences of population subgroups.<sup>[10]</sup>

https://en.wikipedia.org/wiki/Convenience\_sampling

# Diversity in RIS

Similarity matrix for RIS peers IPv4

Similarity matrix for RIS peers IPv6

Adapted from: https://labs.ripe.net/Members/emileaben/how-diverse-is-ris

# Example: BGP Hijacks

- By making RIS more diverse, we'll be able to see hijacks that currently fly under the radar
- Globally visible events we see (but also with much less data)
- Detecting local (scoped) events needs diversity

### How?

### Technical

- BMP / ADD\_PATH
- Focus on multi-hop collectors (regional ones?)

### Incentives

- Value for peers: peer-centric interfaces/analysis?
- T-shirts?

### Targeting?

- Your peers?
- NOGs?
- All (former) state telco's in our service region?

### Conclusion

- We can't answer the "is this representative"-question
- We can asses/steer when new peers add to our diversity

Do we want to move there?

Also, one of the strengths to the 'monitoring as a service' folks is their number of collection points and breadth of ASN to which they interconnect those points/ RISLive, I think, reports out from ~37 or so RIPE probes, how do we (the internet) get more deployed (or better interconnection to the current sets)? and maybe even more imoprtantly... what's the right spread/location/interconnectivity map for these probes?
